

PHILODENDRON MICANS

Cheat Sheet

LIGHT

Bright, indirect light. No direct sunlight.

WATERING

Allow the topsoil to dry out between waterings.

TEMPERATURE

Does best in temperatures of 65-75°F during the day and around 60°F at night.

HUMIDITY

High humidity (>60%) yields the best results. Mist regularly.

PROPAGATION

You can easily propagate your Philodendron Micans via stem cuttings. Propagate in late summer or early spring.

GROWTH

Philodendron Micans is a fast grower. Grows up to 12 inches tall and 24 inches wide.

TOXICITY

Philo Micans is toxic. Keep it away from both children and your pets.

SOIL

Philodendron Micans grows well in any high quality, fast-draining potting mix. A mix of potting soil and peat moss produces great results.

(RE)POTTING

Ceramic pots are a great choice for Philo Micans. Use a pot that is only a bit larger than the root ball.

PESTS & DISEASES

Watch out for aphids, mealybugs, spider mites and scale insects. Use rubbing alcohol and/or neem oil to get rid of these pests.

FERTILIZER

For best results, fertilize monthly during spring and summer months. In winter, fertilize less. Use a balanced liquid fertilizer.

COMMON PROBLEMS

BROWN LEAF TIPS: You are likely underwatering your plant. Other possible reasons for this are too much (direct) sunlight or overfeeding.

Yellow Leaves: Likely caused by either too much or not enough sunlight. Remember: Bright, indirect sunlight is the way to go. Keep out of direct sunlight.
